Return `true` if it is possible to remove one letter so that the frequency of all letters in `word` are equal, and `false` otherwise.

- The **frequency** of a letter  $x$  is the number of times it occurs in the string.
- You **must** remove exactly one letter and cannot chose to do nothing.

**Explanation:** Select index 3 and delete it: word becomes "abc" and each character has a frequency of 1.

**Explanation:** We must delete a character, so either the frequency of "a" is 1 and the frequency of "z" is 2, or vice versa. It is impossible to make all present letters have equal frequency.

- `2 <= word.length <= 100`
- `word` consists of lowercase English letters only.
